

参考解答

一、选择题

1. (B) 2. (B) 3. (C) 4. (D) 5. (D).

二、填空题

1. $\frac{x-x_0}{ax_0} = \frac{y-y_0}{by_0} = \frac{z-z_0}{cz_0}$. 2. $\theta = \frac{\pi}{2}$, 3. 0, 4. $\frac{y^2-x^2}{(x^2+y^2)^2}$, 5. $[-1, 1)$.

三、试解下列各题:

1. (6分) 求过直线 $\frac{x-1}{2} = \frac{y+1}{1} = \frac{z}{-2}$ 且与平面 $x-2y+z-3=0$ 垂直的平面方程.

解 利用平面的点法式方程. 所求平面通过点 $(1, -1, 0)$, 已知直线的方向矢量为 $u = (2, 1, -2)$, 平面的法向为 $n = (1, -2, 1)$, 于是所求平面的法向量可取为

$$n_1 = u \times n = \begin{vmatrix} i & j & k \\ 2 & 1 & -2 \\ 1 & -2 & 1 \end{vmatrix} = -3i - 4j - 5k, \quad \dots\dots\dots 3'$$

$\therefore$ 所求平面方程为 $-3(x-1) - 4(y+1) - 5(z-0) = 0$, 即: $3x + 4y + 5z + 1 = 0$. $\dots\dots\dots 3'$

2. (6分) 设 $z = x^y (x > 0)$, 求 $\frac{\partial^2 z}{\partial x^2}$, $\frac{\partial^2 z}{\partial x \partial y}$, $\frac{\partial^2 z}{\partial y \partial x}$, $\frac{\partial^2 z}{\partial y^2}$.

解 (1) $\frac{\partial z}{\partial x} = yx^{y-1}$, $\frac{\partial z}{\partial y} = x^y \ln x$.

$$(2) \frac{\partial^2 z}{\partial x^2} = \frac{\partial}{\partial x} (yx^{y-1}) = y(y-1)x^{y-2}; \quad \dots\dots\dots 2'$$

$$\frac{\partial^2 z}{\partial x \partial y} = \frac{\partial}{\partial y} \left(\frac{\partial z}{\partial x} \right) = x^{y-1} + yx^{y-1} \ln x; \quad \frac{\partial^2 z}{\partial y \partial x} = \frac{\partial}{\partial x} \left(\frac{\partial z}{\partial y} \right) = yx^{y-1} \ln x + x^{y-1}; \quad \dots\dots\dots 2'$$

$$\frac{\partial^2 z}{\partial y^2} = \frac{\partial}{\partial y} \left(\frac{\partial z}{\partial y} \right) = x^y (\ln x)^2. \quad \dots\dots\dots 2'$$

3. (6分) 设 $z = z(x, y)$ 是由方程 $x(y^2 + z) + e^z = 1$ 确定的隐函数, 求 dz .

解: 方程两边分别对 x, y 求偏导, 则

$$y^2 + z + x \frac{\partial z}{\partial x} + e^z \frac{\partial z}{\partial x} = 0, \quad x \left(2y + \frac{\partial z}{\partial y} \right) + e^z \frac{\partial z}{\partial y} = 0.$$

$$\text{所以 } \frac{\partial z}{\partial x} = -\frac{y^2 + z}{x + e^z}, \quad \frac{\partial z}{\partial y} = -\frac{2xy}{x + e^z}. \quad \dots\dots\dots 3'$$

$$\therefore dz = -\frac{y^2 + z}{x + e^z} dx - \frac{2xy}{x + e^z} dy. \quad \dots\dots\dots 3'$$

4. (6分) 求曲面 $z = x^2 + \frac{y^2}{4} + 3$ 上与 $2x + y + z = 0$ 平行的切平面方程.

解 曲面上点 (x, y, z) 的切平面法向为 $\vec{n} = (-2x, -\frac{y}{2}, 1)$,3'

由 $\vec{n}$ 平行于已知平面法向 $(2, 1, 1)$ 得切点为 $(-1, -2, 5)$,

所以切平面方程为: $2(x+1) + (y+2) + (z-5) = 0$, 即 $2x + y + z - 1 = 0$3'

5. (6分) 设 D 由 $y = -x + 1$, $y = x + 1$ 与 $y = 3$ 所围成的三角形, 求 $\iint_D (2x - y^2) dx dy$.

解 如图所示, $D = \{(x, y) | 1 \leq y \leq 3, 1 - y \leq x \leq y - 1\}$,

$$\therefore \iint_D (2x - y^2) dx dy = \int_1^3 dy \int_{1-y}^{y-1} (2x - y^2) dx \quad \dots\dots\dots 3'$$

$$= \int_1^3 (x^2 - y^2 x) \Big|_{x=1-y}^{x=y-1} dy$$

$$= \int_1^3 (2y^2 - 2y^3) dy = -\frac{68}{3}. \quad \dots\dots\dots 3'$$

6. (6分) 计算二重积分 $\int_0^1 x^2 dx \int_x^1 e^{-y^2} dy$.

解: $\sigma = \{(x, y) : x \leq y \leq 1, 0 \leq x \leq 1\}$ -- x 型区域

$= \{(x, y) : 0 \leq x \leq y, 0 \leq y \leq 1\}$ -- y 型区域

$$\int_0^1 x^2 dx \int_x^1 e^{-y^2} dy = \iint_{\sigma} x^2 e^{-y^2} dx dy = \int_0^1 dy \int_0^y x^2 e^{-y^2} dx \quad \dots\dots\dots 3'$$

$$= \frac{1}{3} \int_0^1 e^{-y^2} y^3 dy = \frac{1}{6} \int_0^1 e^{-y^2} y^2 dy^2 = \frac{1}{6} \int_0^1 e^{-t} t dt = \frac{1}{6} - \frac{1}{3e}. \quad \dots\dots\dots 3'$$

7. (6分) 求球面 $x^2 + y^2 + z^2 = R^2$ 被柱面 $x^2 + y^2 = Rx$ 所割下的立体.

解 根据所求立体的对称性, 只要求出第一卦限的体积

乘以 4 即得所求立体体积. 在第一卦限的立体是个曲顶柱体,

其底为圆心在 x 轴上且过原点的半圆

$D = \{(x, y) | x^2 + y^2 \leq Rx, y \geq 0\}$ 所确定的区域,

顶面是球面方程 $z = \sqrt{R^2 - x^2 - y^2}$,

$$\text{所以 } V = 4 \iint_D \sqrt{R^2 - x^2 - y^2} dx dy \quad \dots\dots\dots 3'$$

$$= 4 \int_0^{\frac{\pi}{2}} d\theta \int_0^{R \cos \theta} \sqrt{R^2 - r^2} r dr$$

$$= \frac{4}{3} R^3 \int_0^{\frac{\pi}{2}} (1 - \sin^3 \theta) d\theta = \frac{4}{3} R^3 \left(\frac{\pi}{2} - \frac{2}{3} \right). \quad \dots\dots\dots 3'$$

8. (6分) 判断级数 $\sum_{n=1}^{+\infty} (-1)^{n-1} \frac{1}{3^n} \left(1 + \frac{1}{n}\right)^{n^2}$ 的敛散性, 若收敛是绝对收敛还是

条件收敛.

解: 由于 $\lim_{n \rightarrow +\infty} \sqrt[n]{|a_n|}$ 3'

$$= \frac{1}{3} \lim_{n \rightarrow +\infty} \left(1 + \frac{1}{n}\right)^n = \frac{e}{3} < 1, \text{ 则级数绝对收敛.} \quad \text{.....3'}$$

9. (9分) 求二元函数 $f(x, y) = x^3 + y^3 - 3xy$ 的极值点和极值.

解: $\frac{\partial f}{\partial x} = 3x^2 - 3y, \frac{\partial f}{\partial y} = 3y^2 - 3x$, 令一阶偏导数等于零, 解方程组:

$$\begin{cases} 3x^2 - 3y = 0 \\ 3y^2 - 3x = 0 \end{cases}, \text{ 解得 } x = 0 \text{ 或 } x = 1, \therefore \text{驻点为 } (0, 0), (1, 1); \quad \text{.....3'}$$

计算二阶偏导数: $\frac{\partial^2 f}{\partial x^2} = 6x, \frac{\partial^2 f}{\partial y^2} = 6y, \frac{\partial^2 f}{\partial x \partial y} = -3$,

$$\text{在点 } (0, 0), \frac{\partial^2 f}{\partial x^2} = 0, \frac{\partial^2 f}{\partial y^2} = 0, \frac{\partial^2 f}{\partial x \partial y} = -3, D = 0 \times 0 - (-3)^2 = -9 < 0,$$

所以 $(0, 0)$ 是鞍点不是极值点.3'

$$\text{在点 } (1, 1), \frac{\partial^2 f}{\partial x^2} = 6, \frac{\partial^2 f}{\partial y^2} = 6, \frac{\partial^2 f}{\partial x \partial y} = -3, D = 6 \times 6 - (-3)^2 = 36 - 9 = 27 > 0,$$

且 $\frac{\partial^2 f}{\partial x^2} = 6 > 0$, 所以 $(1, 1)$ 是极小值点. 此时极小值为 -1.3'

10. (9分) 利用幂级数和函数求数项级数 $\sum_{n=2}^{\infty} \frac{1}{(n^2 - 1)2^n}$ 的和.

解: 设 $S(x) = \sum_{n=2}^{\infty} \frac{x^n}{n^2 - 1}, x \in (-1, 1)$, 则

$$S(x) = \sum_{n=2}^{\infty} \frac{1}{2} \left(\frac{1}{n-1} - \frac{1}{n+1} \right) x^n \quad \text{.....3'}$$

$$= \frac{x}{2} \sum_{n=2}^{\infty} \frac{x^{n-1}}{n-1} - \frac{1}{2x} \sum_{n=2}^{\infty} \frac{x^{n+1}}{n+1} \quad (x \neq 0) = \frac{x}{2} \sum_{n=1}^{\infty} \frac{x^n}{n} - \frac{1}{2x} \sum_{n=3}^{\infty} \frac{x^n}{n},$$

$$S(x) = \left(\frac{x}{2} - \frac{1}{2x} \right) \sum_{n=1}^{\infty} \frac{x^n}{n} + \frac{1}{2x} \left(x + \frac{x^2}{2} \right) \quad (x \neq 0)$$

$$\text{而 } \sum_{n=1}^{\infty} \frac{x^n}{n} = \sum_{n=1}^{\infty} \int_0^x x^{n-1} dx = \int_0^x \left(\sum_{n=1}^{\infty} x^{n-1} \right) dx = \int_0^x \frac{dx}{1-x} = -\ln(1-x)$$

$$\therefore S(x) = \frac{1-x^2}{2x} \ln(1-x) + \frac{2+x}{4} \quad (x \neq 0). \quad \text{.....3'}$$

$$\text{故 } \sum_{n=2}^{\infty} \frac{1}{(n^2 - 1)^2 2^n} = S\left(\frac{1}{2}\right) = \frac{5}{8} - \frac{3}{4} \ln 2. \quad \text{.....3'}$$

11. (4 分) 求由曲面 $z = x^2 + y^2, y = x^2, y = 1, z = 0$ 所围立体的体积 V .

解 由于所围立体的底部为区域 $\sigma = \{(x, y) : x^2 \leq y \leq 1, -1 \leq x \leq 1\}$,

顶部是曲面 $z = x^2 + y^2$, 则

$$V = \int_{-1}^1 dx \int_{x^2}^1 (x^2 + y^2) dy \quad \dots\dots\dots 2'$$

$$= \int_{-1}^1 \left[\left(x^2 y + \frac{1}{3} y^3 \right) \right]_{x^2}^1 dx$$

$$= \int_{-1}^1 \left(x^2 + \frac{1}{3} - x^4 - \frac{1}{3} x^6 \right) dx = \frac{88}{105}. \quad \dots\dots\dots 2'$$
